Hong Kong Olympiad in Informatics 2014 Heat Event (Junior Group) Official Solution

Statistics (N = 182)

Full mark = 45. Maximum = 44. Median = 21. Advance to Final = 24 marks or above.

Section A

| Secu | on A | | | |
|------|------|--|--|--|
| Q | A | Explanation | | |
| 1 | F | The high data transfer speed with optic fiber is due to multiplexing and less signal loss. | | |
| | | In fact, the speed of EM wave (light) in optic fiber is approximately 62% (1/1.62) of | | |
| | | speed of light in vacuum while the speed (electric signal propagation speed) in coaxial | | |
| | | cable is approximately 66%, which is higher. | | |
| 2 | T | The ASCII code of "A" is 65 while that of "a" is 97. | | |
| 3 | T | The range of short int is -32,768 to 32,767 | | |
| 4 | F | The first character of an identifier (variable name) cannot be a number | | |
| 5 | F | Instructions take different amount time to execute. For example, dividing two numbers | | |
| | | is slower than adding them. | | |
| 6 | В | Place 7 bishops in row 4 to achieve the goal. | | |
| 7 | С | The program will simply output every multiple of 3 from 1 to 10 | | |
| 8 | В | There is one branch with statements for both cases. There are also no loops. | | |
| 9 | D | Neither integer*string not string*integer is valid. | | |
| 10 | A | The symbol represents the logical operator "OR". OR is associative, meaning that the | | |
| | | expression can become (NOT U OR U) OR V, which is TRUE OR V, which is TRUE. | | |
| 11 | D | We can draw a graph like this: | | |
| | | Tryndamere \leftrightarrow Taric \leftrightarrow Xin Zhao \leftrightarrow Jarvan IV | | |
| | | Master Yi ↔ Wukong | | |
| | | Lee Sin ↔ Garen | | |
| | | Number of pairs of friends = $4C2 + 1 + 1 = 6 + 2 = 8$ | | |
| 12 | C | The $a[k+1] = j$ at the end of the loop body inserts the new number in the correct | | |
| | | position, which shows that the program implements insertion sort. | | |
| 13 | A | Multiplication, division and modulo are all left-associative. This means that the | | |
| | | expression should be evaluated as $((72 / 12) / 6) \% 4$ | | |
| 14 | D | From the third sentence we know that he got full marks in the exam, which means he | | |
| | | had a nice meal based on the second sentence. From the first sentence we know that he | | |
| | | must have studied hard the night before exam. For the fourth sentence, it is equivalent | | |
| | | to saying that Tom will play computer games if and only if he is happy. | | |
| | | | | |

| Q | A | Explanation | | | |
|--------------------------------|--|--|--|--|--|
| 15 | В | 12 = 1100(2), 4 = 0100(2), 12 & 4 = 0100(2). | | | |
| | | $10 = 01010(2), 21 = 10101(2), 10 \mid 21 = 11111(2)$ | | | |
| | | Hint: If the operands are positive, the result of & would not be larger than the smaller | | | |
| | | operand. The result of would not be smaller than the larger operand. | | | |
| 16 | В | Only ordinal data types such as int, char, bool can be used. | | | |
| | Hint: floating point operations are not performed in the ALU. | | | | |
| 17 B Let's simulate the queue: | | Let's simulate the queue: | | | |
| | | Enqueue(3): [3] | | | |
| | Enqueue(4): [3 4] | | | | |
| Enqueue(5): [3 4 5] | | Enqueue(5): [3 4 5] | | | |
| | | Enqueue(6): [3 4 5 6] | | | |
| | | Dequeue(): [4 5 6] | | | |
| | | Dequeue(): [5 6] | | | |
| | | Enqueue(Dequeue()): [6 5] | | | |
| | | Enqueue(7): [6 5 7] | | | |
| | | Dequeue(): [5 7] | | | |
| | | The next Dequeue() then returns 5. | | | |
| 18 | D | The number of ways to form x is the sum of number of ways to form x -1 and x -2. | | | |
| | | \$1: 1 way. \$2: 2 ways. \$3: $1 + 2 = 3$ ways. \$4: $2 + 3 = 5$ ways. | | | |
| | | 5: 3 + 5 = 8 ways. $6: 5 + 8 = 13$ ways. | | | |
| 19 | В | Let's track the value of x: $3 -> 2 -> 5 -> 4 -> 7 -> 6 -> 9$ | | | |
| 20 | A Let's track the value of $j: 1 -> 0 -> 2 -> 3 -> 7 -> 4 -> 5 -> 8$ | | | | |
| | | Finally, the output is a[8], which is 2 | | | |
| 21 | A | Let's track the value of a[j]: $2 -> 3 -> 7 -> 4 -> 5 -> 8 -> 2 ->$ (repeats) | | | |
| | | The cycle length is 6 and the loop is executed 10008 times. $10008 \equiv 0 \pmod{6}$ | | | |
| 22 | A | $x*x*2 = 2^{31}$ which exceeds the maximum range of integer. | | | |
| | | The left hand side would be negative so the output is false. | | | |
| 23 | C | We can safely store a 16-bit integer into a 32-bit integer without losing information. | | | |
| 24 | C | Notice the triple 3s, [K] must be M (the loop that repeats 3 times). | | | |
| 25 | A | The output number is smallest when it has the fewest digits. | | | |
| | | Number of digits for | | | |
| | | A: $2 * 3 * (4 + 1) = 30$ | | | |
| | | B: $3 * 4 * (2 + 1) = 36$ | | | |
| | | C: $4 * 2 * (3 + 1) = 32$ | | | |
| | | D: $4 * 3 * (2 + 1) = 36$ | | | |

Section B

| | Answer and Explanation | | | | |
|--|---|--|--|--|--|
| A | 52 | | | | |
| | Try all possible options: 0, 1, 2, 3, 4, 5 packs of cabbage. | | | | |
| B1 | n=1 | n==1 | | | |
| B2 | f:=2 | return 2 | | | |
| C | n*2+1 | | | | |
| | The first fourth prime numbers are 2, 3, 5, 7. | | | | |
| | Except the first one, others can be calculated by formula n*2-1 | | | | |
| D | 4.875 | | | | |
| | Just calculate the sum of the positive numbers and divide the sum by 8 | | | | |
| E | Any answer that satisfies: | | | | |
| | $(x+y) - 4294967296 = -170, x \le 2147483647, y \le 2147483647$ | | | | |
| | Example: 2147483647 2147483479 | | | | |
| | Notice that $100 + 200 + x + y = 32.5 \times 4$. Therefore $x + y = -170$. | | | | |
| | The trick is to make use of overflow to achieve negative number. | | | | |
| F | Logic | | | | |
| G | 21 | 59 | | | |
| Н | halt end | return 0;} | | | |
| Originally, when n is a triangular number, both lines will be printed. | | | | | |
| | We need to stop the program in the body of the if statement. | | | | |
| I | swap(p,p+1) | | | | |
| J1 | p>0 | | | | |
| J2 | p:=p-1 | p=p-1 | | | |
| K | p:=p+1 | p=p+1 | | | |
| | Alternative answer for J2: p=0 | | | | |
| | ne program implements insertion sort. | | | | |
| | A new element will be swapped into correct place | ce before moving on to the next element. | | | |
| L | a[j]:=a[i]-a[j] | a[j]=a[i]-a[j] | | | |
| | This is one of the many ways to swap two elements without using a temporary variable. | | | | |
