Answer 答案: \_\_\_\_\_ A \_\_\_\_\_ (2 marks 分)

2. Given a positive integer  $n$ , we say  $n$  is:

給定一正整數  $n$ ，稱  $n$  為：

- Abundant, if the sum of factors of  $n$  is larger than  $2n$ ;  
盈數，如果  $n$  的因數之和大於  $2n$ ；
- Deficient, if the sum of factors of  $n$  is smaller than  $2n$ ;  
虧數，如果  $n$  的因數之和小於  $2n$ ；
- Perfect, if the sum of factors of  $n$  is equal to  $2n$ .  
完全數，如果  $n$  的因數之和等於  $2n$ 。

For example, the sum of factors of 4 is  $1 + 2 + 4 = 7$ , which is smaller than  $2 \times 4 = 8$ , so 4 is deficient. The sum of factors of 28 is  $1 + 2 + 4 + 7 + 14 + 28 = 56$ , which is equal to  $2 \times 28 = 56$ , so 28 is perfect.  
例如，4 的因數之和是  $1 + 2 + 4 = 7$ ，小於  $2 \times 4 = 8$ ，所以 4 是虧數。28 的因數之和是  $1 + 2 + 4 + 7 + 14 + 28 = 56$ ，等於  $2 \times 28 = 56$ ，所以 28 是完全數。

You need to write a program which, given input  $n$ , determines if  $n$  is abundant, deficient, or perfect.

你需要編寫程式，對於輸入  $n$ ，判斷  $n$  是盈數、虧數、還是完全數。

It is guaranteed that  $n$  is a positive integer in the range  $[1, 10^7]$ .

保證  $n$  是在  $[1, 10^7]$  以內的正整數。

(a) First, you need write a function `sum_factors()`, which, given parameter  $n$ , returns the sum of factors of  $n$ .  
首先，你需要編寫函數 `sum_factors()`，給定參數  $n$ ，傳回  $n$  的因數之和。

Complete the code below, so that it checks all positive integers smaller than or equal to  $n$ , then returns the sum of those that divides  $n$ .

完成以下代碼，使得它檢查所有小於或等於  $n$  的正整數，然後傳回當中整除  $n$  的數的總和。

### Pascal

```
function sum_factors(n: longint): longint;
var
  sum: longint = 0;
  i: longint;
begin
  for _____ B _____ do
  begin
    if (n mod i = 0) then
      sum := _____ C _____
  end;
  sum_factors := sum
end;
```

### C / C++

```
int sum_factors(int n) {
  int sum = 0;
  int i;
  for (_____ B _____) {
    if (n % i == 0)
      sum = _____ C _____;
  }
  return sum;
}
```

(d) Now, you have a correct and efficient implementation of the function `sum_factors()`. Complete the program below, calling the function when appropriate, so that the program correctly determines whether the input number  $n$  is abundant, deficient, or perfect.

現在，對於函數 `sum_factors()`，你有一個正確且高效的實現。完成下面的程序，在適當的時候呼叫該函數，使得程序正確地判斷輸入數字  $n$  是盈數、虧數、還是完全數。

int main() {
  scanf("%d", &n);
  sum = F;
  if (G1)
    printf("Abundant"); // 盈數
