Zoo Planning HKOI 2007 Junior Question 1

Wong Ho Wa

January 13, 2006

Statistics

Summary

# Attempts	60
Max Score	90
Min Score	0
Mean	40.82
Median	0
Mode	0

Problem

Story

Build the largest zoo with a fountain at the center

Constraints

100% Constraints

$1 < W, H \leq 10^7, 1 \leq K \leq 3000$

50% Constraints

$1 \leq W, H \leq 10^3, 1 \leq K \leq 1000$

Naïve Solutions

$O(KW^2H^2)$ Solution Expected Score:20

Pseudocode of NaïveSolution #1

```
for  $i = 1$  to  $W$  do
  for  $j = 1$  to  $H$  do
    for  $a = 1$  to  $W$  do
      for  $b = 1$  to  $H$  do
        if only one cross in the rectangle  $(i+1,j+1)$  ,  $(a-1,b-1)$  then
          update the maximum area when necessary
        end if
      end for
    end for
  end for
end for
output the maximum area
```

Observations

Observation #1

Optimization can be independent of the size of the map(W, H)

Naïve Solutions (Continued)

Improving Naïve Solution #1

$O(K^3)$ Solution Expected Score:50

Pseudocode of Naïve Solution #2

```
for  $i = 1$  to  $K$  do
  for  $j = i + 1$  to  $K$  do
     $x_1 \leftarrow \text{Crosses}[i] \rightarrow x$ 
     $y_1 \leftarrow \text{Crosses}[i] \rightarrow y$ 
     $x_2 \leftarrow \text{Crosses}[j] \rightarrow x$ 
     $y_2 \leftarrow \text{Crosses}[j] \rightarrow y$ 
    if only one cross in the rectangle  $(x_1 + 1, y_1 + 1), (x_2 - 1, y_2 - 1)$  then
      update the maximum area when necessary
    end if
  end for
end for
output the maximum area
```

Efficient Solutions

Redefining the problem

Change the problem into "For a given cross (x_i, y_i) , what are a, b, c, d s.t.

$$a = \min\{x_i \text{ s.t. } x < x_i\}$$

$$b = \min\{y \text{ s.t. } y < y_i\}$$

$$c = \max\{x \text{ s.t. } x > x_i\}$$

$$d = \max\{y \text{ s.t. } y > y_i\}$$

Efficient Solutions (Continued)

$O(K^2)$ Solution Expected Score:100

Pseudocode of Efficient Algorithm #1

```
for  $i = 1$  to  $K$  do  
   $a = \min\{x \text{ s.t. } x < x_i\}$   
   $b = \min\{y \text{ s.t. } y < y_i\}$   
   $c = \max\{x \text{ s.t. } x > x_i\}$   
   $d = \max\{y \text{ s.t. } y > y_i\}$   
  update the maximum area when necessary  
end for  
output the maximum area
```

Efficient Solutions (Continued)

Improving efficient algorithm #1 by using binary search
 $O(K^2)/O(K \lg K)$ Solution Expected Score:100

Pseudocode of Efficient Algorithm #2

```
sort(X)
sort(Y)
for  $i = 1$  to  $K$  do
   $a = \min\{x \text{ s.t. } x < x_i\}$ 
   $b = \min\{y \text{ s.t. } y < y_i\}$ 
   $c = \max\{x \text{ s.t. } x > x_i\}$ 
   $d = \max\{y \text{ s.t. } y > y_i\}$ 
  update the maximum area when necessary
end for
output the maximum area
```

Observations (Continued)

Observation #2

Optimization of width and height are two independent processes.

\therefore All roads are either running from the north boundary of the city to the south boundary or running from the west boundary to the east boundary.

- Common Mistakes
- Question ?

Efficient Solutions (Continued)

By observation #2, the maximum width and maximum height can be determined separately.

Redefining the problem again

What are the maximum height and maximum width?

Efficient Solutions (Continued)

$O(K)$ Solution Expected Score:100

Pseudocode of Efficient Solution #3

```
remove duplicated  $x_i$ 
remove duplicated  $y_i$ 
sort X
sort Y
width  $\leftarrow \max\{y_i - y_{i-2} - 1 \text{ s.t. } 3 \leq i \leq |Y|\}$ 
height  $\leftarrow \max\{x_i - x_{i-2} - 1 \text{ s.t. } 3 \leq i \leq |X|\}$ 
output the maximum area
```

Common Mistakes

- Trivial Case
- Boundary Case
- Using too many memories
