## Secret message

## Problem description

A string is transformed to another string by Burrow-Wheeler Transform

Final string --> initial string

Full : N<=2*10^5

## $15 \%$ solution

- only 'A', ‘B’ and '\#', N <= 10
- Enumeration
- $\mathrm{O}\left(2^{\wedge} \mathrm{N}\right)$

## Observation

- what is the first letter in the origianl string?
- Do we know the characters in first column?
- Relation between first character and last character?

## $20 \%$ solution

- $\quad \mathrm{N}<=27$, all characters are unique
- sort the characters given to obtain first column
- start from the row that contains '\#' in last column
- Let the character be $x$, move on to the next row that contains $x$ in last column, and push $x$ into answer string, repeat until the string is full
- $\mathrm{O}\left(\mathrm{N}^{\wedge} 2\right)$ to $\mathrm{O}(\mathrm{N})$ depends on how you implement it

## Observation

- Problem arises if characters are not unique
- Seems we have no clue about where the next row is

## Observation

- For the character ranked x (among the same character) in the first column, the character it represents in the last column also ranks x (among the same character)

## $100 \%$ solution

- $\mathrm{N}<=2^{*} 10^{\wedge} 5$
- sort the characters given to obtain first column
- start from the row that contains '\#' in last column
- Let the character be $x$, move on to the next row that $x$ represents in the last column, and push x into answer string, repeat until the string is full
- $\mathrm{O}\left(\mathrm{N}^{\wedge} 2\right)$ to $\mathrm{O}(\mathrm{N})$ depends on how you implement it

## Implementation stuff

How to sort characters in the original string in $\mathrm{O}(\mathrm{N})$ ?
Bubble sort $\mathrm{O}\left(\mathrm{N}^{\wedge} 2\right)$
Merge sort $\mathrm{O}(\mathrm{N} \lg \mathrm{N})$
Count sort $\mathrm{O}(\mathrm{N}+\mathrm{E}) \mathrm{E}=$ number of characters available

How do we get the next row in $\mathrm{O}(1)$ ?
2D array
