# HKOI 2015/16 Solution Senior Q1 (Military Training) 

Alex Tung
23/1/2016

## Task Description

- Given a $\mathrm{N}^{*} \mathrm{~N}$ grid
- A robot starts on ( $r_{0}, c_{0}$ )
- It moves according to a sequence of commands
- Each command is up (U), down (D), left (L), right (R)
- Ends until the robot moves out of grid

## Task Description

- Command length is K, repeats infinitely
- e.g. "ULLD" $\rightarrow$ Robot moves up $\rightarrow$ "LLDU" $\rightarrow$ Robot moves left $\rightarrow$ "LDUL" ...
- Robot won't be back to ( $\mathrm{r}_{0}, \mathrm{c}_{0}$ ) after K steps
- Task: find maximal number of times a square is visited

## 50\% Solution

- Pure simulation $)^{-}$
- declare f[2002][2002]; set f[i][j] to 0
- set $r=r_{0}, c=c_{0}$
- while robot is not out of grid
- move ( $r, c$ )
- add 1 to $\mathrm{f}[\mathrm{r}][\mathrm{c}]$
- output $\max (f[i][j])$

## Example $\left(\mathrm{N}=4,\left(\mathrm{r}_{0}, \mathrm{c}_{0}\right)=(1,1)\right.$, move $=$ "RDL" $)$

| $(1,1)$ | $(1,2)$ | $(2,2)$ | $(2,1)$ |
| :---: | :---: | :---: | :---: |
|  | $(2,2)$ | $(3,2)$ | $(3,1)$ |
|  | $(3,2)$ | $(4,2)$ | $(4,1)$ |
|  | $(4,2)$ | $(5,2) \rightarrow$ END |  |

## Observation 1

- There exists a most frequently visited cell on the first row

| $(1,1)$ | $(1,2)$ | $(2,2)$ | $(2,1)$ |
| :---: | :---: | :---: | :---: |
|  | $(2,2)$ | $(3,2)$ | $(3,1)$ |
|  | $(3,2)$ | $(4,2)$ | $(4,1)$ |
|  | $(4,2)$ | $(5,2) \rightarrow$ END |  |

## Observation 2

- No need to consider the robot's movement beyond row ( $\mathrm{K}+1$ )

| $(1,1)$ | $(1,2)$ | $(2,2)$ | $(2,1)$ |
| :---: | :---: | :---: | :---: |
|  | $(2,2)$ | $(3,2)$ | $(3,1)$ |
|  | $(3,2)$ | $(4,2)$ | $(4,1)$ |
|  | $(4,2)$ | $(5,2) \rightarrow$ END |  |

## Idea

- (1) There exists a most frequently visited cell on the first row
- Only need to declare an array to count the cells "around" ( $r_{0}, c_{0}$ )
-     + /- $2000\left(\mathrm{~K}_{\text {max }}\right)$ is enough
- (2) No need to consider robot's movement beyond row ( $K+1$ )
- Only need to simulate the first $\mathrm{K}^{2}$ moves

## Full solution

- declare f[4002][4002]; set f[i][j] = 0
- set $s x=2000, ~ s y=2000$
- set $r=r_{0}, c=c_{0}$
- for i from 1 to $K^{2}$
- move ( $r, c$ ) and ( $s x, s y$ )
- if $(r, c)$ is out of grid
- break
- if $0<=s x<=4000$ and $0<=s y<=4000$
- add 1 to f[sx][sy]
- output max(f[i][j])

## Thank you

- Any questions?
