## Statistic

S173 Monster G0

## Statistic

S173 Monster G0

## Background

## Problem Statement

- N monsters live in N caves
- Different monsters live in different caves

## Problem Statement

- Given a list of M radars
- Each radar have a given set of caves in range
- Each radar can show the monsters in the caves in range in an arbitrary order

## Problem Statement

| Cave | 1 | 2 | 3 | 4 |
| :---: | :---: | :---: | :---: | :---: |
| Monster | C | A | B | D |

\section*{|  | Radar | Cave | Cave |
| :---: | :---: | :---: | :---: |
| Rave |  |  |  |
| 2 | 3 | 4 |  |}

- $\{A, B, D\}$
- $\{A, B\}$
- $\{D, A, B\}$
- $\{C, A, B, D\}$
- $\{B, A, D\}$
- $\{B, C, D\}$

## Problem Statement

- Output the minimum number K such that the first $K$ radars can determine the location of each monster
- $\Leftrightarrow$ there is exactly one permutation of monster locations corresponding to the information of the K radars

## Example

- $N=2, M=2$
- Range of radar 1 = \{cave 1, cave 2$\}$
- Range of radar 2 = \{cave 2$\}$
- Ans: K = 2
- Radar 1 actually gives no useful information
- The monster in cave 1 can be determined by method of elimination once the monster in cave 2 is known

## Subtask 1

- $N, M<=2$
- When $\mathrm{N}=1$
- No need radar
- Output 0
- Monster 1 always lives in cave 1

## Subtask 1

- $N, M<=2$
- When $N=2$
- Possible ranges of radars
- $\{1\},\{2\},\{1,2\}=\{2,1\}$
- $3+3^{2}$ (or $4+4^{2}$ ) possibilities
- Hardcode

## Subtask 2

- $N<=2, ~ N M<=2 e 5$
- When $N=2$
- Possible ranges of radars
- $\{1\},\{2\},\{1,2\}=\{2,1\}$
- Done $\Leftrightarrow\{1\}$ or $\{2\}$ appear

## Observation

- Cave i and Cave j are distinguishable
$\Leftrightarrow$ you can partition $N$ monsters into two groups such that the monsters in cave $i$ and cave j are in different groups
$\Leftrightarrow$ the sets of radars in range are different

## Observation

- Denote the sets of radars in range by $R_{i}$ and $R_{j}$ for cave $i$ and cave $j$ respectively
- If $\mathrm{R}_{\mathrm{i}}=\mathrm{R}_{\mathrm{j}}$

Then the monsters in cave $i$ and cave j will be both present or both absent in the result of each radar
$\rightarrow$ Not distinguishable

## Observation

- If $R_{i} \neq R_{j}$

Then there is one radar such that cave i is in range and cave $j$ is not in range, or in the other way $\rightarrow$ Monsters can be partitioned by the result of that radar $\rightarrow$ Distinguishable

- Thus, different set $\Leftrightarrow$ distinguishable

## Observation

- The radars are enough
$\Leftrightarrow$ the caves are pairwise distinguishable
$\Leftrightarrow$ the sets of radars in range are pairwise different

## Subtask 3

- $\mathrm{N}<=10, \mathrm{NM}<=2 \mathrm{e} 5$
- After a radar is added
- Set the pair of caves to be distinguishable if one is present and one is absent
- Check if every pair of caves is distinguishable
- $O\left(N^{2} M\right)$

## Subtask 4

- $N, M<=2 e 5, N M<=2 e 5$
- "Not distinguishable" is an equivalence relation
- So the monsters can be partitioned into equivalence classes

## Subtask 4

- $N, M<=2 e 5, N M<=2 e 5$
- "Not distinguishable" is an equivalence relation
- So the monsters can be partitioned into equivalence classes

## Subtask 4

- $N, M<=2 e 5, N M<=2 e 5$
- If A, B are not distinguishable and B, C are not distinguishable
- Then A, C are not distinguishable
- Monsters can be partitioned into groups such that the members are pairwise not distinguishable

## Subtask 4

- $N, M<=2 e 5, N M<=2 e 5$
- Reduce unnecessary checking
- Recall

Same set $\Leftrightarrow$ not distinguishable

- How to efficiently check the equality of set?

## Subtask 4

- For each cave, define a binary number where the $i^{\text {th }}$ digit represents whether the cave is in the range of radar i

## Subtask 4

- Radar $1=\{1\}$
- Radar $2=\{1,2\}$
- Radar $3=\{2\}$
- Cave $1=110_{2}$
- Cave $2=011_{2}$
- Cave $3=000_{2}$

## Subtask 4

- If the N numbers are distinct
- (can be checked by hashing)
- Then it is done
- O(NMlogN)

## Subtask 4

- If the N numbers are distinct
- (can be checked by hashing)
- Then it is done
- O(NMlogN)
- Not intended

## Subtask 5

- $N, M<=2 e 5$, input size $=0(2 e 5)$
- Not to check every N numbers after a radar is added

## Subtask 5

- $N, M<=2 e 5$, input size $=0(2 e 5)$
- Not to check every N numbers after a radar is added
- Else TLE

## Subtask 5

- Method 1
- If the first $x$ radars are enough
- Then the first y (y > x) radars are also enough
- Binary search
- O(NlogNlogM)

## Subtask 5

- Method 1
- If the first $x$ radars are enough
- Then the first y (y > x) radars are also enough
- Binary search
- O(NlogNlogM)
- Not intended

## Subtask 5

- Method 2
- Notice that a group is split when the members are not all in range OR all not in range for the newly added radar

## Subtask 5

- Method 2
- Implementation
- Define a group id for each group
- Split group $\rightarrow$ change id
- Only change id of those included in input

## Subtask 5

- Method 2

| Cave | 1 | 2 | 3 | $\ldots$ | N |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Group id | 1 | 1 | 1 | 2 | K |

- Radar $=\{1,2\}$

| Cave | 1 | 2 | 3 | $\ldots$ | N |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Group id | $K+1$ | $K+1$ | 1 | 2 | $K$ |

## Subtask 5

- Method 2

| Cave | 1 | 2 | 3 | $\ldots$ | N |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Group id | 1 | 1 | 1 | 2 | K |

- $\operatorname{Radar}=\{1,2,3\}$

| Cave | 1 | 2 | 3 | $\ldots$ | N |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Group id | 1 | 1 | 1 | 2 | K |

## Subtask 5

- Method 2

| Cave | 1 | 2 | 3 | $\ldots$ | N |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Group id | 1 | 1 | 1 | 2 | K |

- $\operatorname{Radar}=\{1,2,3\}$
$\begin{array}{lllllll}\text { Cave } & 1 & 2 & 3 & \text {... }\end{array}$
Group id $K+1 K+1 K+1 \quad 2 \quad K$

## Subtask 5

- Method 2

| Cave | 1 | 2 | 3 | $\ldots$ | N |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Group id | 1 | 1 | 1 | 2 | K |

- $\operatorname{Radar}=\{6,8,9\}$

| Cave | 1 | 2 | 3 | $\ldots$ | N |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Group id | 1 | 1 | 1 | 2 |  |

## Subtask 5

- Method 2

| Cave | 1 | 2 | 3 | 4 | $\ldots$ | N |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Group id | 1 | 1 | 2 | 2 | 3 | K |

- Radar $=\{2,3\}$

| Cave | 1 | 2 | 3 | 4 | $\ldots$ | $N$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Group id | 1 | $K+1$ | $K+2$ | 2 | 3 | $K$ |

## Subtask 5

- Method 2
- O(input size)
- Expected score $=100 \quad: D$

## Thank you
