# J213 Paint the Wall 

Author：Alex Tung Setter：Hei Chit Cheng Solution：Ian Wong

## J213－Paint the Wall

## Problem

Given a R＊C grid，initially all cells are white，paint K cells to black．Maximize pairs of adjacent cells with different color．

|  | $\begin{aligned} & l \text { cases: } \\ & 2, C \leq 10 \\ & V \leq R \times \end{aligned}$ |  |
| :---: | :---: | :---: |
|  | Points | Constraints |
| 1 | 13 | $R=1$ |
| 2 | 18 | $\begin{aligned} & R=2 \\ & 2 \leq C \leq 100 \end{aligned}$ |
| 3 | 9 | $R=C=3$ |
| 4 | 8 | $\begin{aligned} & R \times C \text { is even } \\ & N=\frac{R \times C}{2} \end{aligned}$ |
| 5 | 29 | $R \times C$ is even |
| 6 | 23 | No additional |

## Subtask 3

$R=C=3$
You can solve $K=1 . .9$ on paper and hardcode it，or writing a brute force algorithm to generate all possible colourings and find the optimal one．

Time complexity： $\mathrm{O}(1)$ or $\mathrm{O}\left(2^{\wedge}\left(\mathrm{R}^{*} \mathrm{C}\right)\right)$

## Main Observation 1

Notice that when $K>R * C / 2$ ，the problem can be transformed to，initially all cells are＇ 1 ＇，we are changing $R$＊$C$－K cells to＇ 0 ＇．So，we can solve the original problem with $\mathrm{K}=\mathrm{R}$＊ $\mathrm{C}-\mathrm{K}$ and flip the cell color at last．
From now on，we assume that $\mathrm{K}<=\mathrm{R} * \mathrm{C} / 2$.

## Subtask 1

$R=1$

Intuitively，we know when C is odd，we should choose cell 2，4，．．．，C－1．（row 1） And when C is even，we can choose $1,3, \ldots, C-1$ or $2,4, \ldots, C$ ．

Why the parity of C matters？Think about C＝3，we have to choose the middle cell since only it has two neighbours．In general，we don＇t really want to choose cell 1 or C unless we have no choice．

## Main Observation 2

When $K<=R$＊C／2，in optimal answer，we will never paint two adjacent cells with＇ 1 ＇．We can always construct such answer（choose odd or even columns）．

## Subtask 1

Since in both cases（ $C$ is even or odd），start choosing from 2 is optimal． So we will paint cell $2,4,6, \ldots$ and stop when we have painted $K$ cells． Time complexity：O（C）

## Subtask 2

$R=2, C<=100$
We can extend main observation 2 ，and it also works when $\mathrm{R}=2$ ．
When $K=R$＊C／2，we know our answer will be：

What if $K<R * C / 2$ ？

## Main Observation 3

We can pick the cells greedily．
When $R=2$ and $C=5$ ，we have 5 choices to paint．
Notice that we can consider these choices independently and it wouldn＇t affect others，as we would never paint both adjacent cells with＇ 1 ＇．

Hong Kong Olympiad in Informatics

## Subtask 2

We want to greedily paint cells that have more adjacent neighbours（cells that aren＇t located in column 1 or C ）．

For example，when $R=2, C=5$ and $K=3$ ，the solution below is one of the optimal solutions．

Time complexity：$O\left(R^{*} \mathrm{C}\right)$

香港電腦奧林匹克競賽
Hong Kong Olympiad in Informatics

## Subtask 4

$R * C$ is even and $K=R * C / 2$.
With our intuition or the observation we have，main observation 2 and indeed it works in general case（ $R>2$ ），we can notice that we will be painting the grid like this：
（1，1），（1，3），．．．
（2，2），（2，4），．．．
$(3,1),(3,3), \ldots$

Time Complexity：O（R＊C）

香港電腦奧林匹克競賽
Hong Kong Olympiad in Informatics

## Subtask 5

$R$＊$C$ is even
We can combine our idea in subtask 2 and 4 ．We are picking $K$ non－adjacent cells to paint them as＇ 1 ＇and we are picking them greedily by their number of adjacent neighbours．So we are picking K cells from here：
$(1,1),(1,3), \ldots$
$(2,2),(2,4), \ldots$
$(3,1),(3,3), \ldots$

## Subtask 5

$K=1$
$K=2$
$K=6$

Time complexity：$O\left(R^{*} \mathrm{C}\right)$

## Subtask 6

## No additional constraints

Why doesn＇t subtask 5＇s idea work in general？
When $\mathrm{R}=\mathrm{C}=3, \mathrm{~K}=4$ ：
it is better to paint it in the way of the left one than the right one．

香港電腦奧林匹克競賽
Hong Kong Olympiad in Informatics

## Main Observation 4

We have two（and only two）different choosing mechanisms for non－adjacent cells：
1．choose cell $(i, j)$ where $i+j=0(\bmod 2)$
2．choose cell $(i, j)$ where $i+j=1(\bmod 2)$

When $R$＊$C$ is even，two methods are the same．（Imagine $R=4$ and $C=4$ ）
When $R$＊$C$ is odd，one might yield a better result．

## Subtask 6

We try both methods and pick the one with larger result．
Time complexity：O（R＊C）
